Backup figure 1

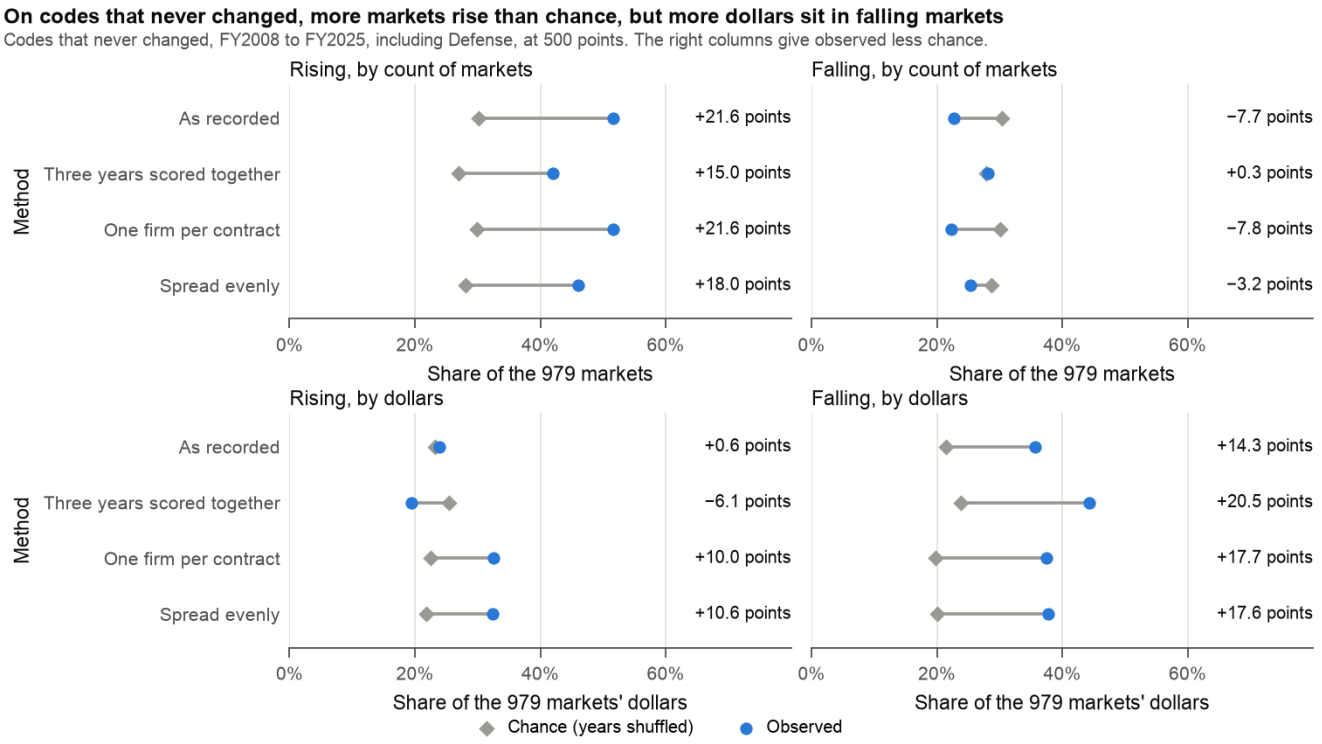

Do more dollars sit in rising markets than chance would explain?

With contracts as recorded, 28.57% of dollars sit in rising markets against 17.41% by chance, and every method keeps a gap of about 10 to 13 points.

Backup figure 2

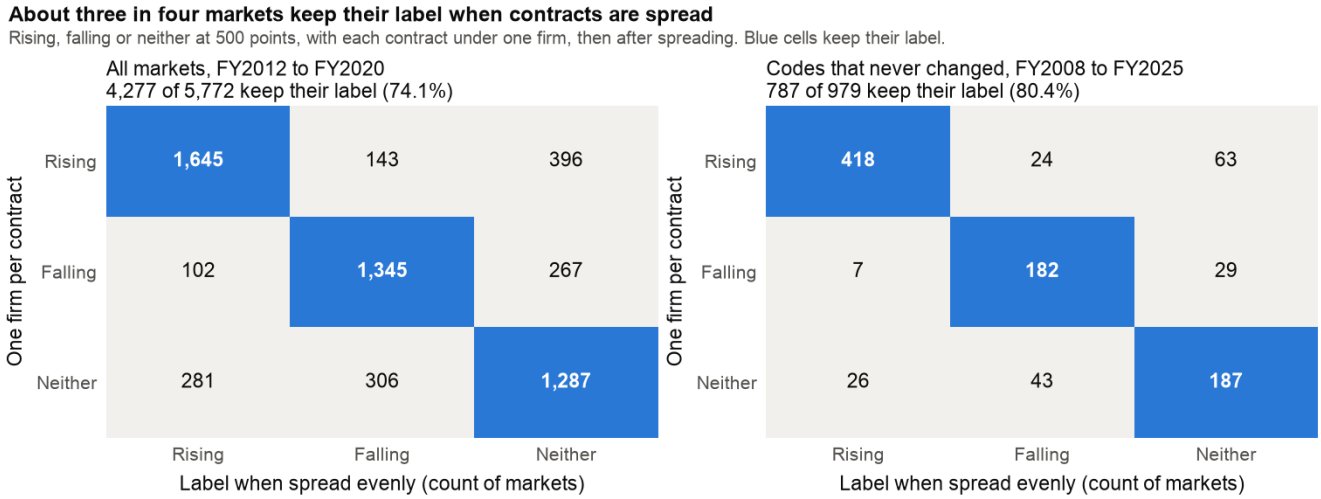

Do markets on codes that never changed rise too?

By count they rise well beyond chance, 51.69% against 30.12% as recorded, but by dollars more sits in falling markets under every method, and as recorded rising does not beat chance (23.84% against 23.20%).

Backup figure 3

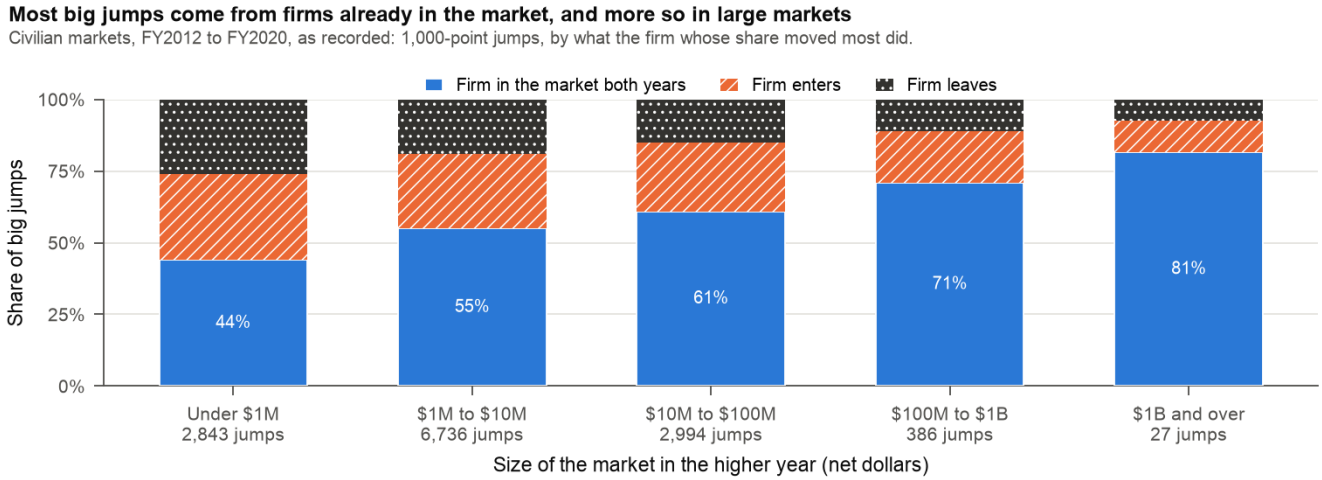

Do the same markets rise when contracts are spread?

Mostly yes: 4,277 of the 5,772 markets keep their label, and a quarter change.

Backup figure 4

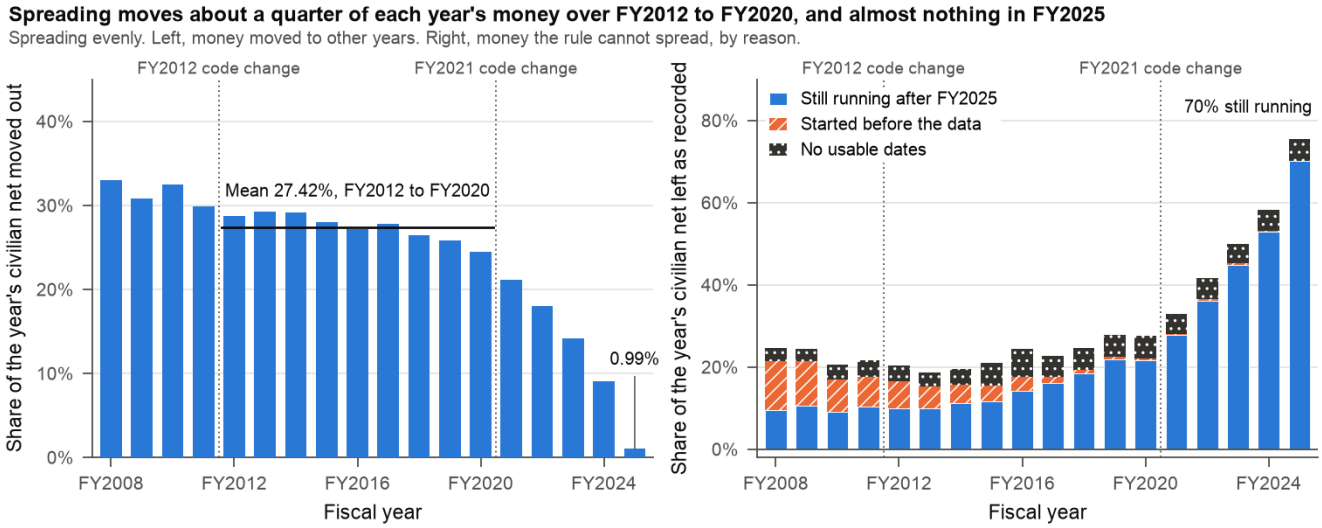

In which markets do big jumps happen, and does the moving firm enter or leave?

Of 12,986 civilian jumps, 54% come from a firm in the market both years, 26% from a firm entering and 19% from a firm leaving, and the share from firms staying rises with market size, though the top band holds only 27 jumps.

Backup figure 5

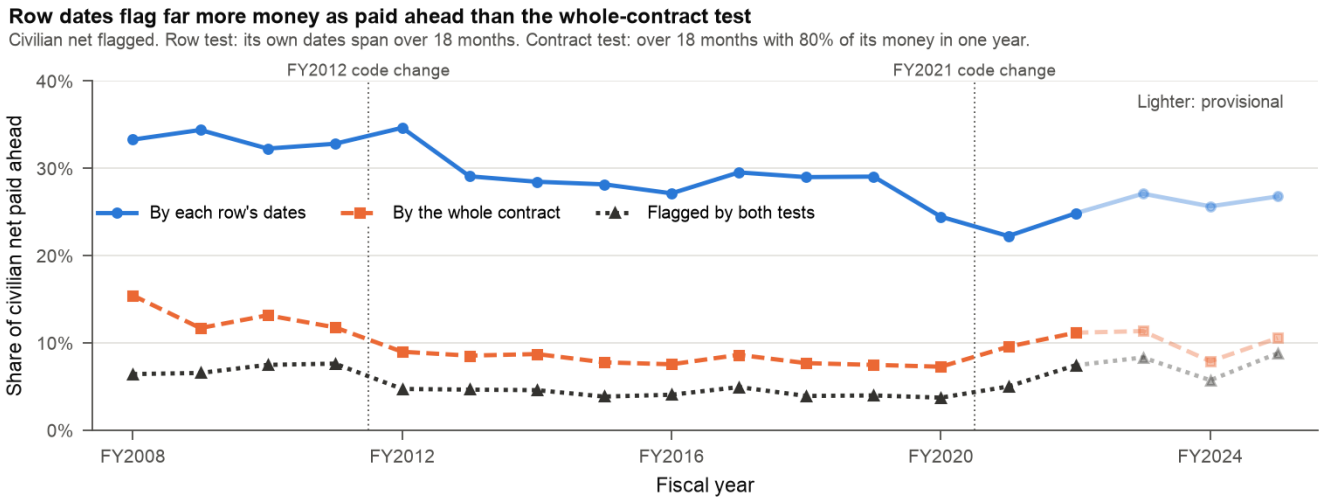

How much money does spreading move, and why does the rest stay?

Spreading moves a mean of 27.42% of each year's civilian net over FY2012 to FY2020 and 0.99% in FY2025, where contracts still running hold 70% of the money.

Backup figure 6

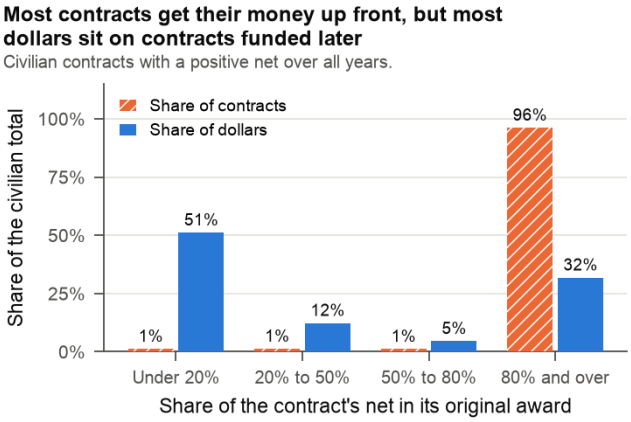

How much money is paid ahead, judged two ways?

Row dates flag about 25% to 33% of civilian net by era, the whole-contract test about 8% to 13%, and both tests flag about 4% to 7%.

Backup figure 7

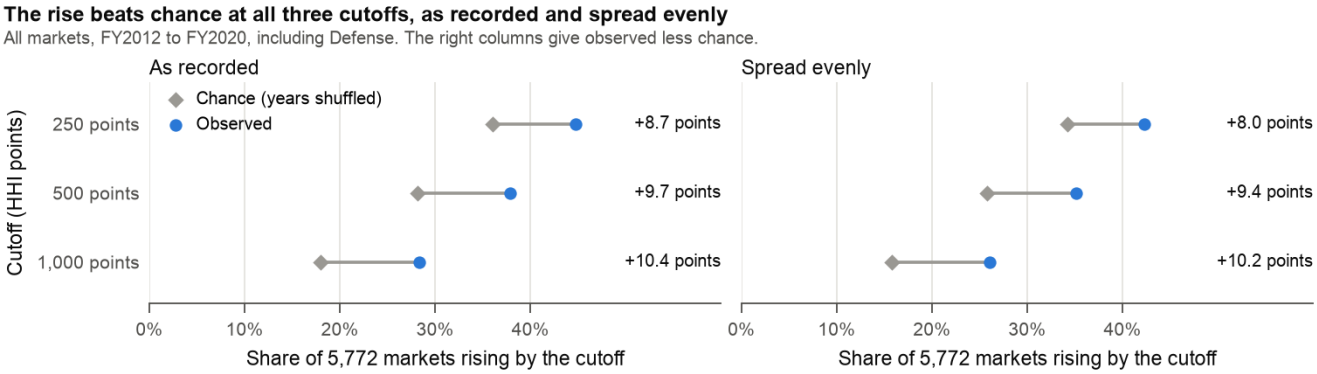

Do contracts get their money up front?

Most do, with 96.21% of contracts getting 80% or more in the original award, but those hold only 31.85% of dollars, and contracts under 50% hold 63.55%.

Backup figure 8

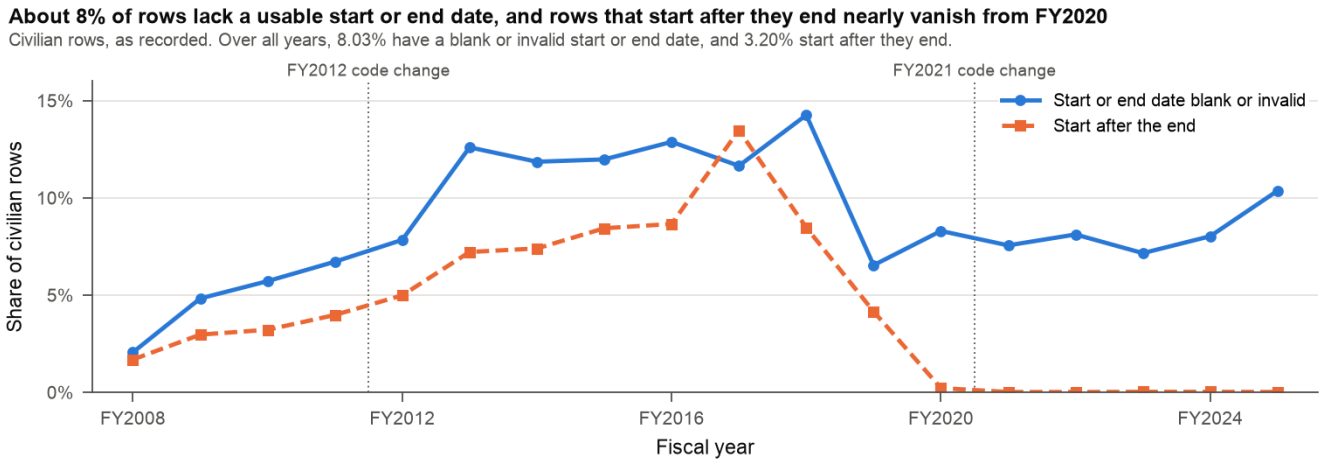

Does the rise depend on the 500-point cutoff?

The gap over chance holds at 250, 500 and 1,000 points, as recorded and spread evenly.

Backup figure 9

How clean are the contract dates that spreading rests on?

Over all years 8.03% of civilian rows have a blank or invalid start or end date and 3.20% start after they end, which peaks at 13.47% in FY2017 and is near zero from FY2020.
