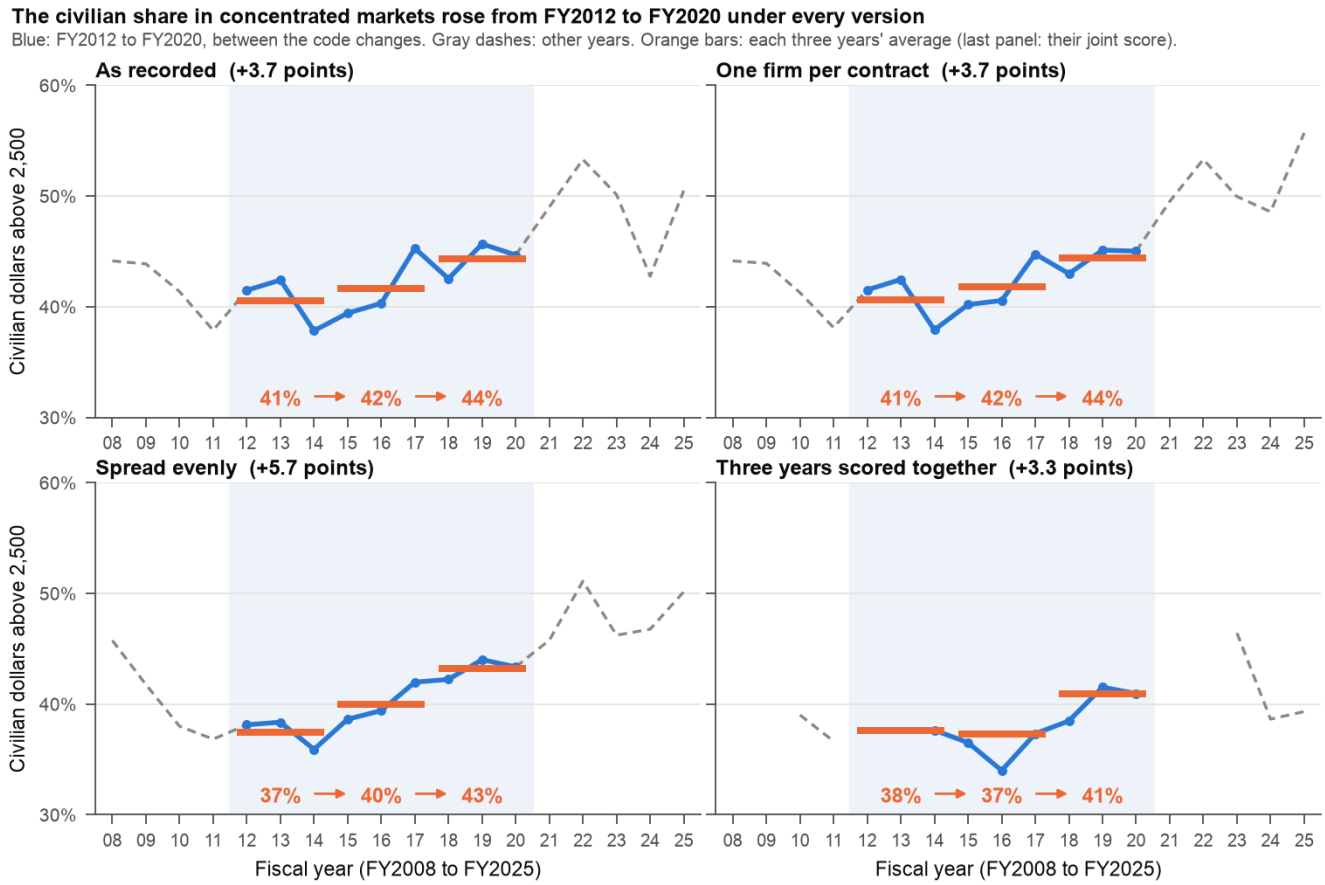

Figure 1a

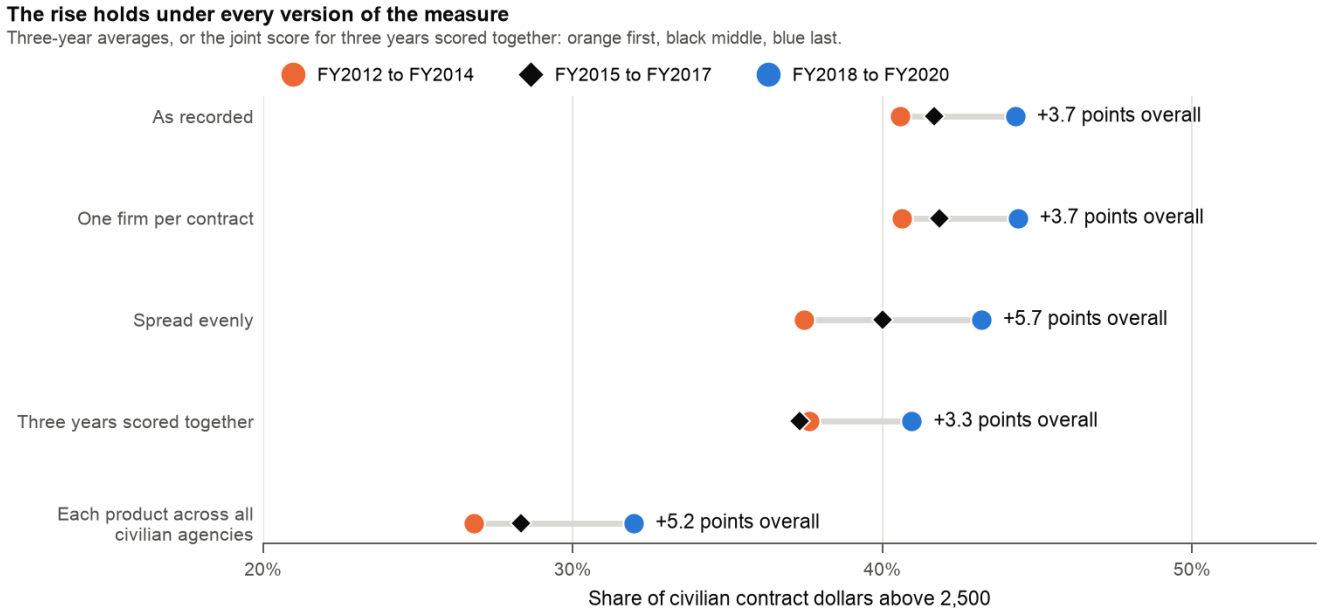

Is the civilian share of concentrated dollars rising?

Between the first and last three-year periods, the share rises by 3.7 points as recorded, 3.7 with one firm per contract, 5.7 spread evenly and 3.3 with three years scored together, whose middle period dips first.

Figure 1b

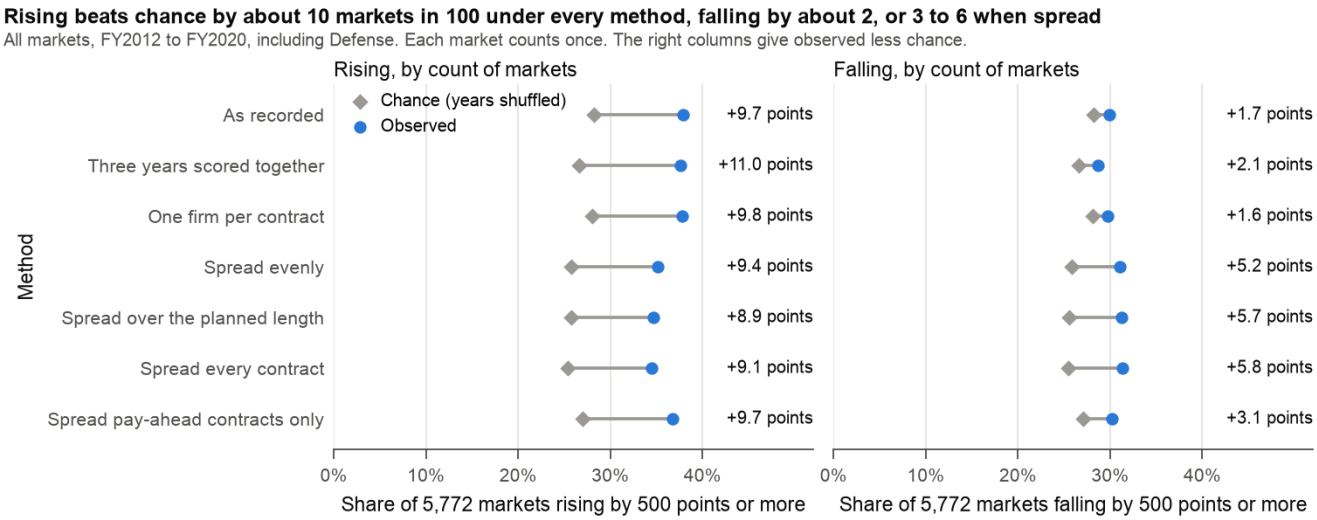

Does the rise hold under every version, including markets drawn across all civilian agencies?

Every version shown ends higher than it starts, by 3.3 to 5.7 points, though three years scored together falls 0.3 points first, and scoring each product across all civilian agencies lowers the level but still gives a rise of 5.2 points.

Figure 2

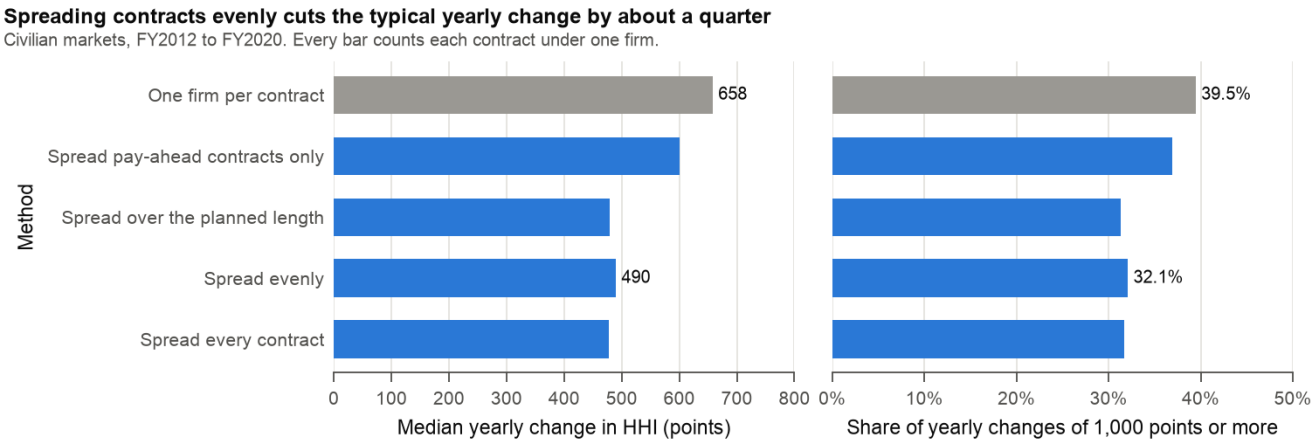

Do more markets rise, or fall, than chance would explain, counting each market once?

With contracts as recorded, 37.92% of markets rise against 28.2% by chance, and every method keeps a gap of about 9 to 11 points, while falling beats chance by 1.6 to 5.8 points, most once contracts are spread.

Figure 3

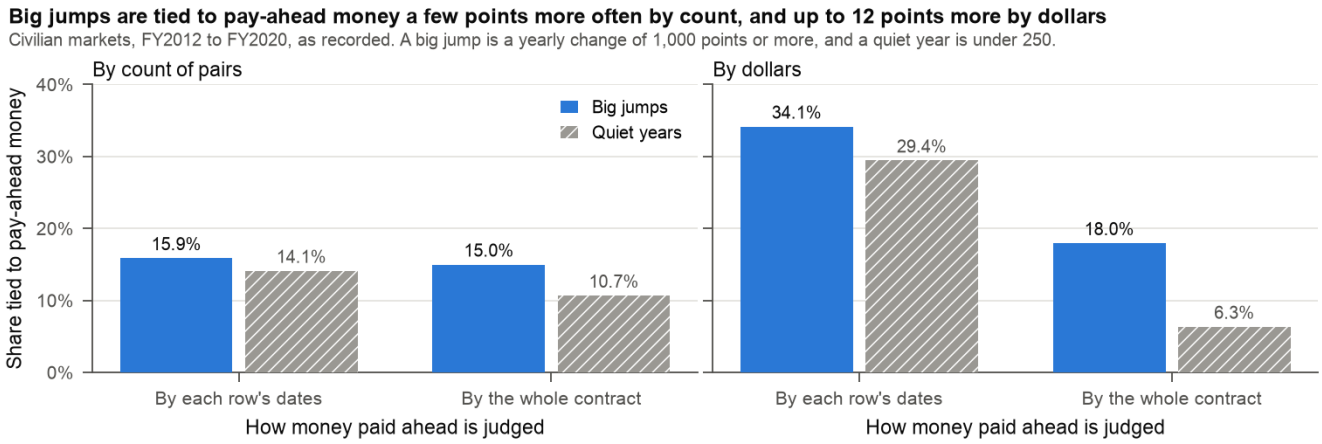

Does contract timing drive the swings?

It drives part of them: with each contract under one firm, spreading cuts the median yearly change on civilian markets from 658.2 to 490.2 points and jumps from 39.47% to 32.1% of yearly changes, and spreading only pay-ahead contracts gives about a third of that calming.

Figure 4

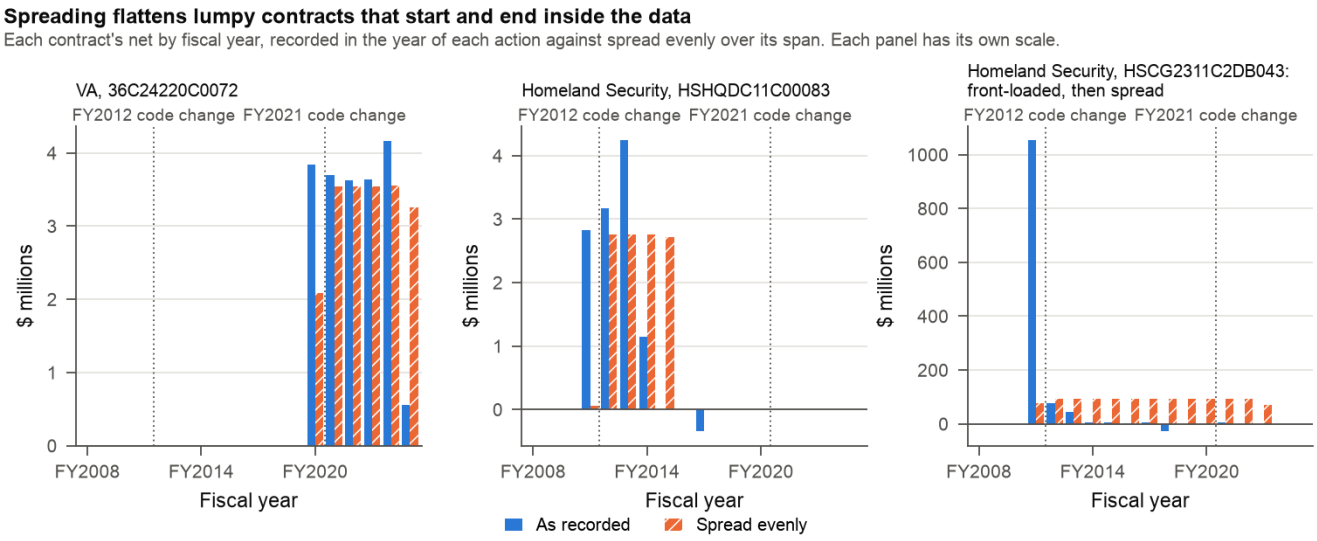

Are big jumps tied to money paid ahead?

By count, only a few points more often than quiet years (14.97% against 10.66% by the whole contract), while by dollars the whole-contract gap is wider (17.95% against 6.33%).

Figure 5

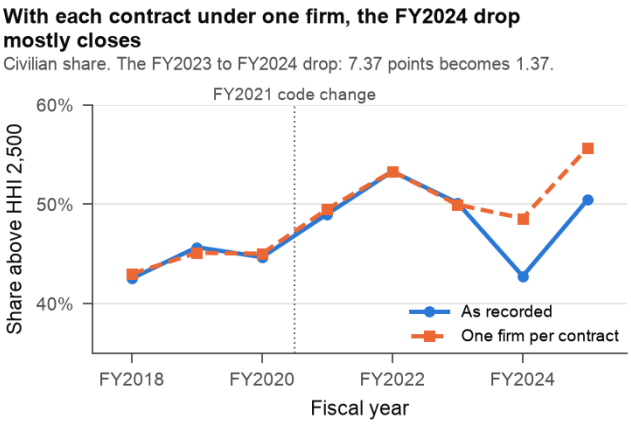

What does spreading do to one contract?

It evens out a contract's yearly money over the years it ran, most plainly on a contract with a lump of money up front, but the even spread leaves contracts still running after FY2025 where they were recorded.

Figure 6

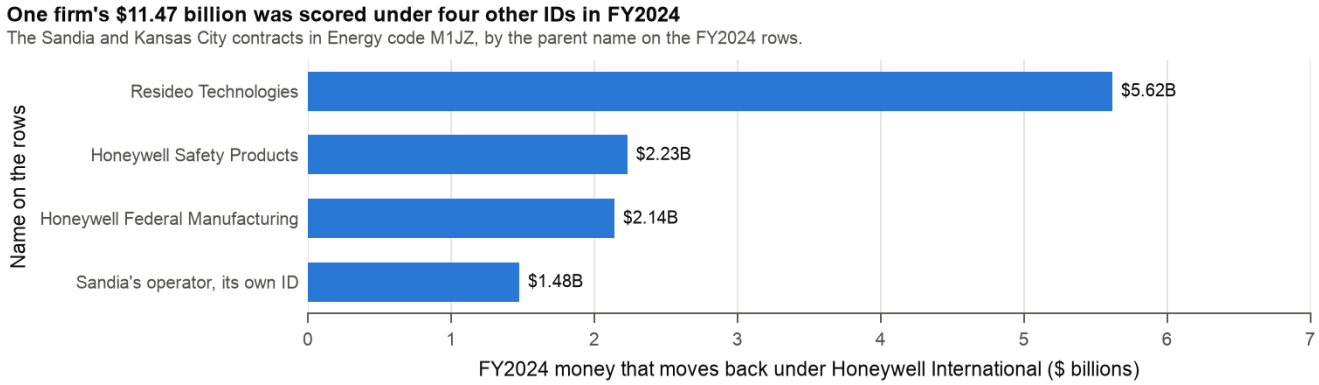

Does one firm per contract close the FY2024 dip?

It closes most of the drop from FY2023, which goes from 7.37 points to 1.37, but FY2025 still sits 7 to 8 points above FY2024 either way.

Figure 7

Which IDs held Honeywell's FY2024 money?

The $11.47 billion sat under four other IDs, $5.62 billion of it under the Resideo-named ID, and the rest under Honeywell-named IDs or the Sandia operator's own ID, and that Energy market alone gives 5.41 of the 5.82 points FY2024 regains.
